

An Intelligent Decision Support System for Material Planning and Production Process Optimization in Smart Factories

Problem to Solve

- Inventory management
- Production bottlenecks
- Existing methods are difficult to deploy in real factories

How to Solve

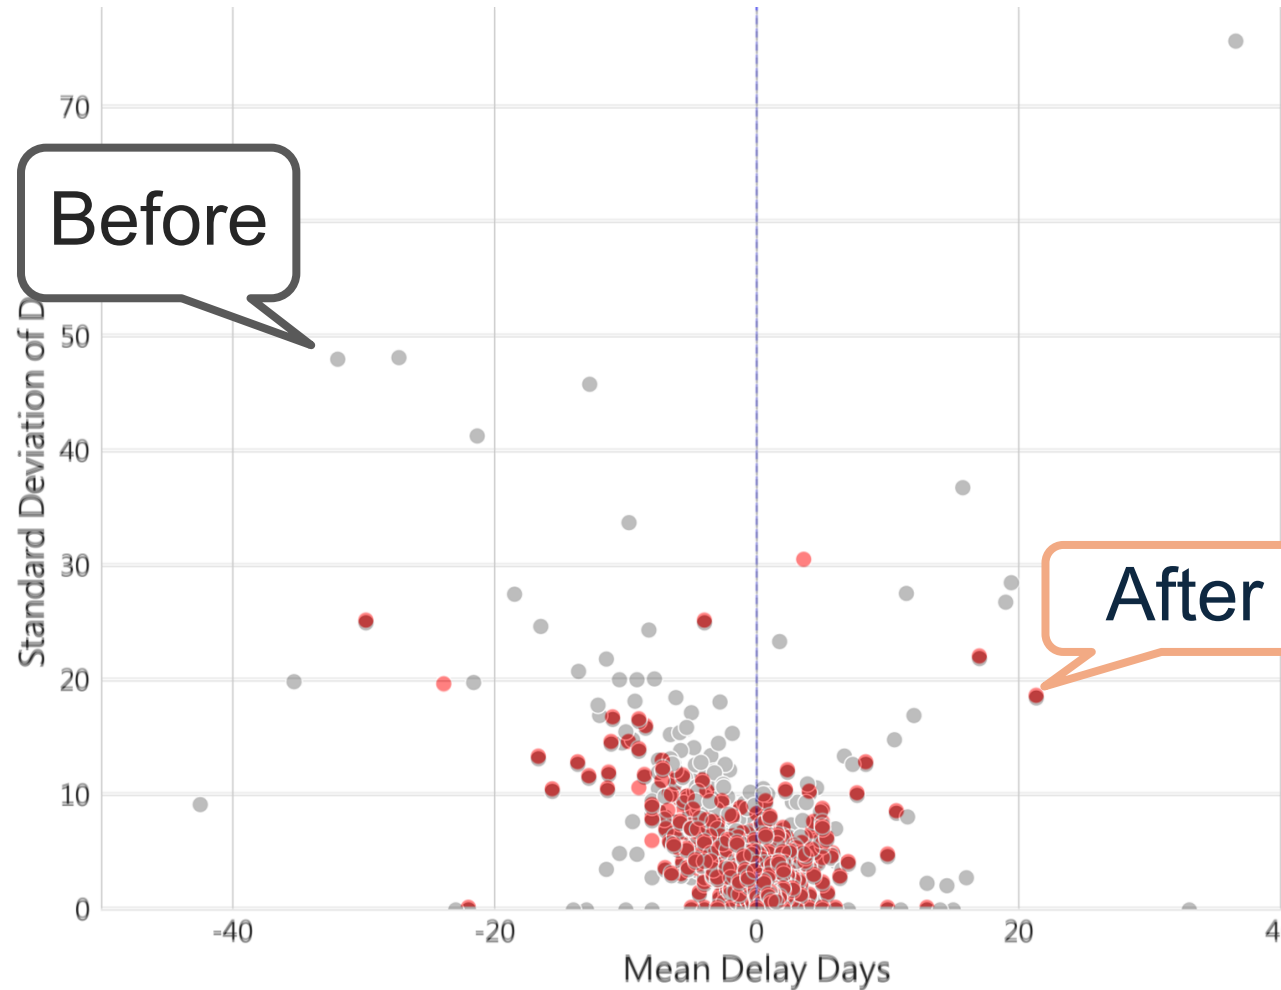

- Overall System Architecture

Data Source

ERP ID	Description	Content
MOCTA/B	Manufacturing Orders	Orders, processes, and required materials
INVMB	Material Master Data	Basic material information
PURTG	Inbound Records	Ordering and inbound information

Data Cleaning

- Removing missing values
- Retain production-related data
- Filter out low-frequency samples
- Exclude outliers using the $1.5 \times \text{IQR}$ rule

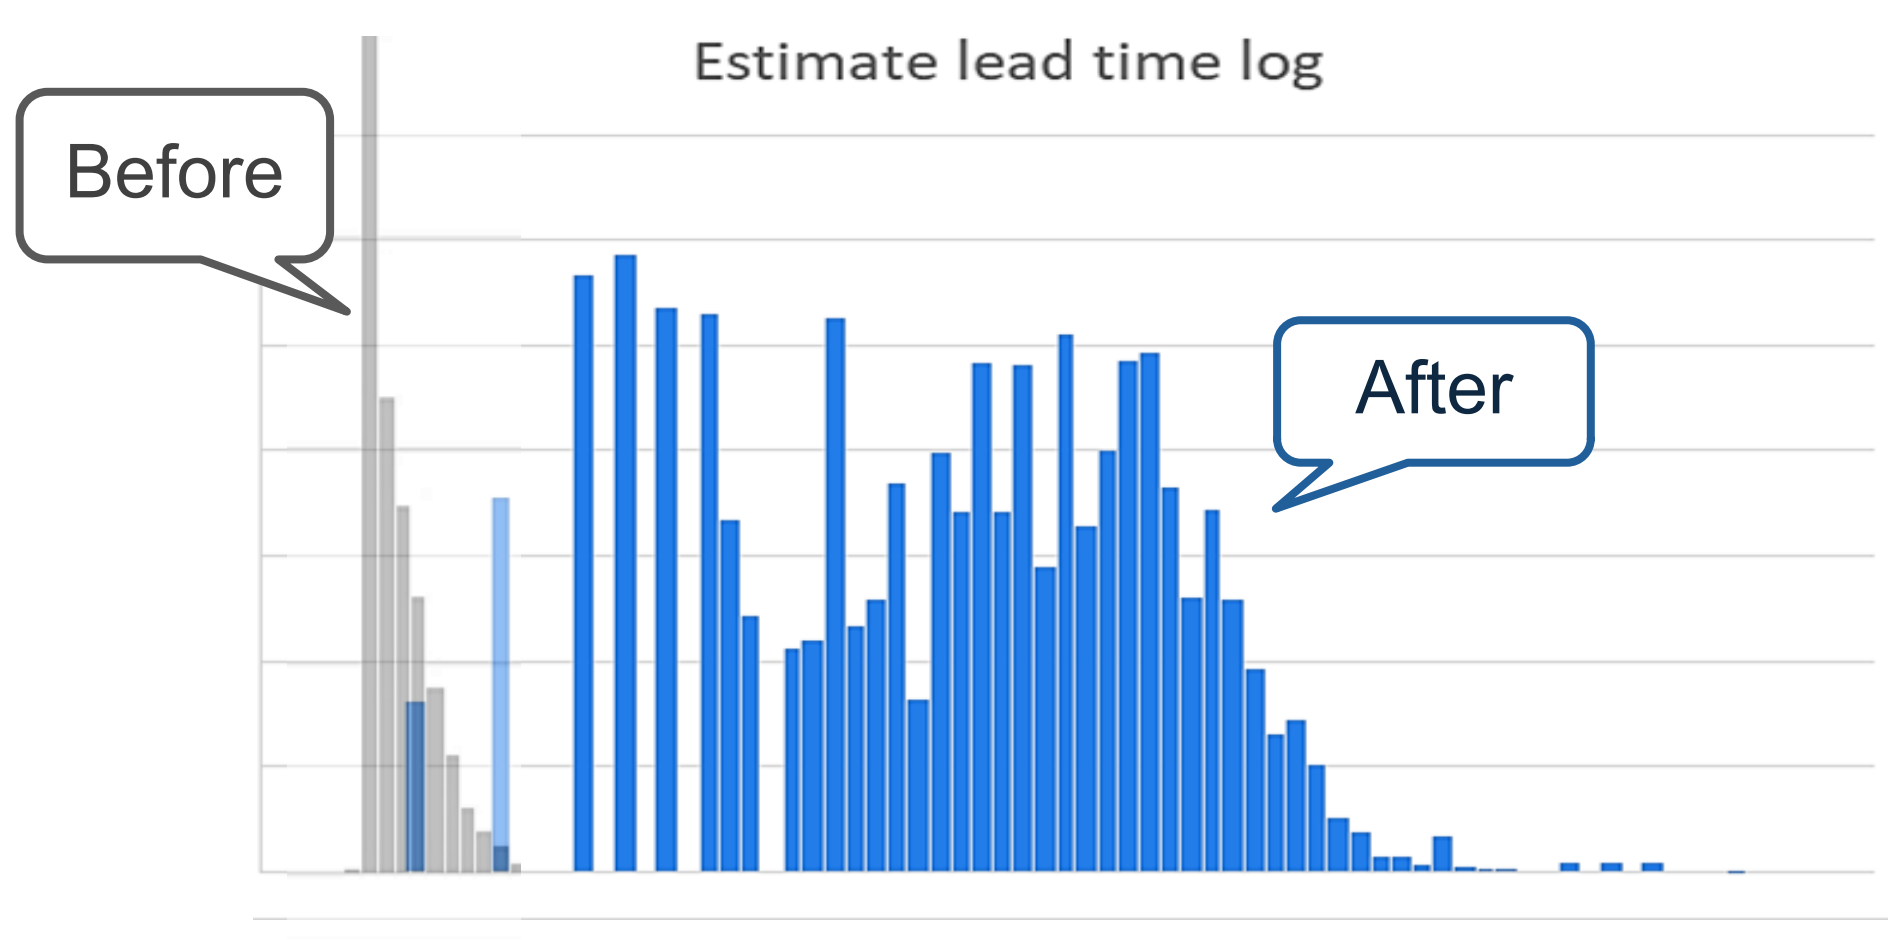

Two Predictive Models

- Material Lead-Time Prediction Model
- Process Completion Prediction Model

Feature Engineering & Preprocessing

- Static Features
 - ID, name, amount, specification, date...
- Dynamic Features
 - MA3, MA5, MAX, MIN, CV...
- Make Data Gaussian-like

Make Data Gaussian-like

Two Predictive Models' Result

Model	RMSE	MAE	MAPE (%)	R ²
LightGBM	2.550	1.394	10.20	0.984
XGBoost	2.528	1.396	10.26	0.985
CatBoost	2.616	1.494	10.86	0.983
NN	3.911	2.455	13.80	0.965

System Interface

Functions we want to achieve

- View manufacturing orders, processes, and materials
- Support data editing and synchronization
- Provide a practical to-do list for daily operations

System Interface – Main Page

conclusion

- Validated with real factory ERP data
- Integrated material planning and bottleneck analysis
- Translated model outputs into a deployable decision support system
- Supports more practical scheduling and material-planning decisions

THANK YOU
